Big Data Scenario mit Power BI vs. SAP HANA

Gerhard Brückl

About me

Gerhard Brückl

Working with Microsoft BI since 2006

Started working with SAP HANA in 2013

focused on Analytics and Reporting

Try Out SAP HANA in a Big Data Scenario

Posted by [Greg Chase](#) in [Blog](#) on Oct 24, 2013 10:28:41 AM

Just in time for SAP TechEd, I'm pleased to announce the public beta of the trial cloud for SAP HANA. Our first released scenario is [SAP HANA One and Big Data](#) – Processing Wikipedia Data with Hive and Analyzing with SAP HANA and SAP Lumira.

The trial cloud for SAP HANA provides you fast, free access to pre-configured SAP HANA landscapes built for specific use cases. This lets you see how to work with SAP HANA through short tutorial activities.

 SAP HANA

<http://www.saphana.com/community/blogs/blog/2013/10/24/try-out-sap-hana-in-a-big-data-scenario>

Background

Wikimedia Foundation provides data for Wikipedia usage
- hourly page-view statistics

<http://dumps.wikimedia.org/other/pagecounts-raw/>

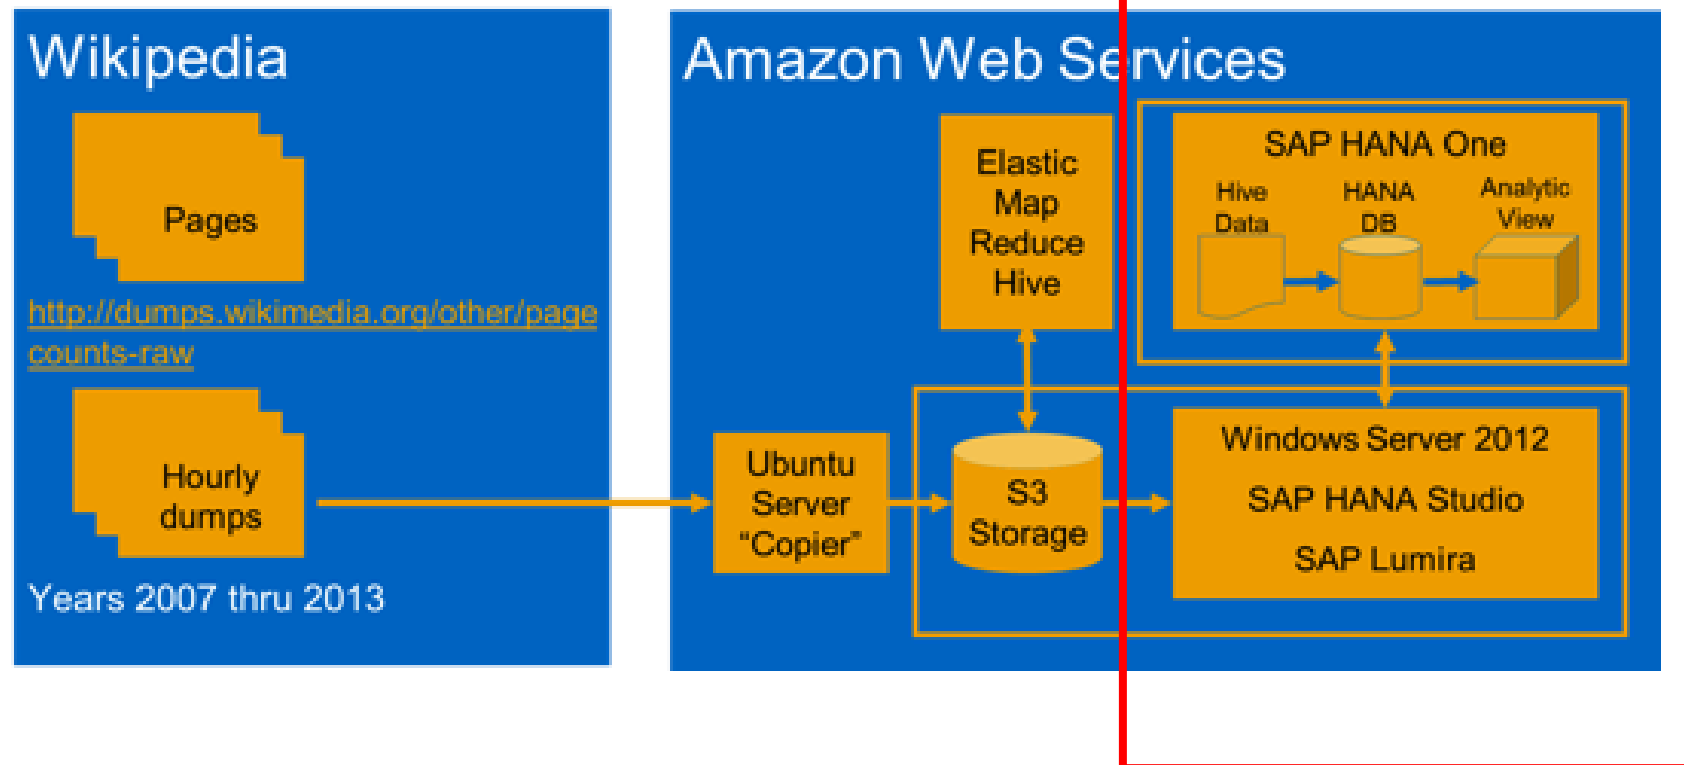

Loaded raw-files into Amazon S3 storage (~750 GB)

Create HIVE-table on top of raw-files

Extract important data from HIVE-table to CSV-files
WHERE [Page Count]/Hour \geq 100

(Start analysis)

Setup

Basic Comparison

SAP HANA		Microsoft Power BI
Enterprise DB Solution	Use Case	Self-Service BI Solution
SUSE Linux Enterprise (Server)	Platform	Microsoft Excel 365 / 2013 (Client)
In-memory Column Store	Technology	In-memory Column Store
Scalable	Performance	"Limited"
Scalable	Storage	Limited
Supported	MPP	No
	...	
Not Free	Price	Free

Is it a valid comparison?

No

Why do we still compare it? And what does it have to do with Big Data?

Big Data scenarios usually start on a Green Field

- Vague imagination of what we want
- We can not know in advance what we get
- Maybe the goal changes/shifts because of new insights??
- Can we use the results at all??

ROI – Was the investment worth it?

The concept of Lab & Factory

Lab & Factory – not a new Concept

Lab & Factory

- Small dataset
- Full complexity
- Experimental approach
- No fixed results

- Large dataset
- Necessary complexity
- Fixed outcome
- Scalability

Identify Field – Lab or Factory?

Hourly page-view statistics over 3 months

Prefiltered using HADOOP and HIVE

What do we actually want to analyze?

Dataset: Small / pre-filtered

Complexity: not going to change

Output: not defined

Laboratory	Factory
X	
X	
X	

The laboratory

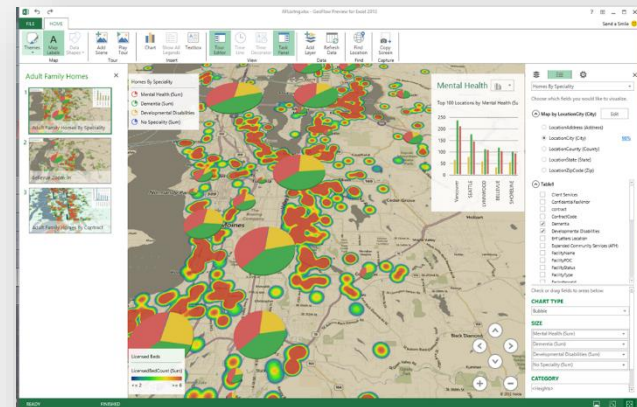

Try & Error

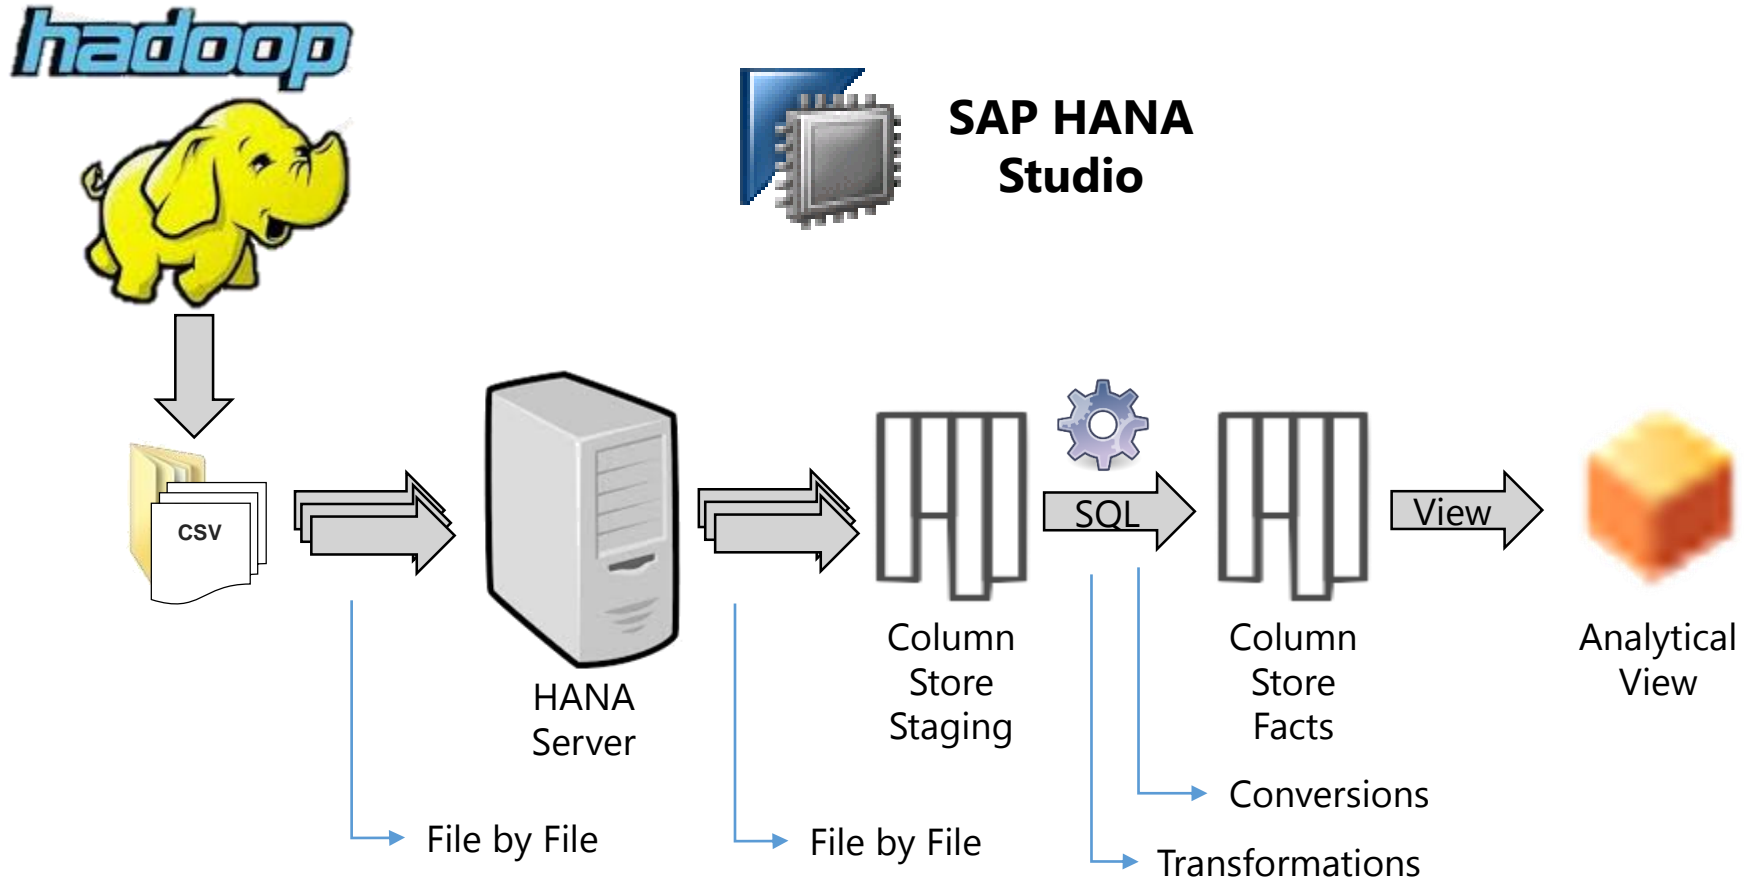

Fast Iterations

Complex Analysis

Visualization

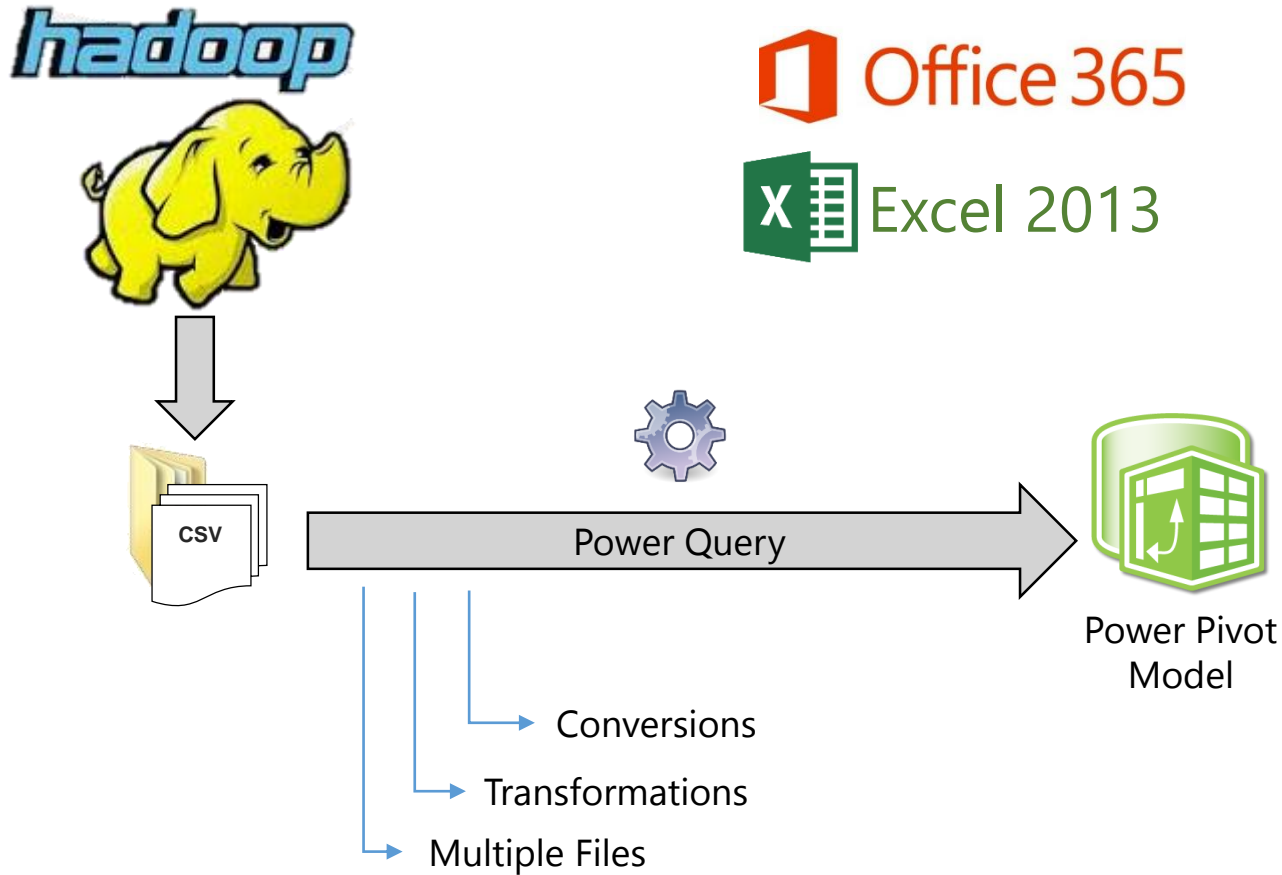

Workflow – SAP HANA

DEMO SAP HANA

Workflow – Microsoft Power BI

DEMO

Microsoft Power BI

Try & Error

- SAP HANA
 - Finding errors in data can be tricky
 - Data Transformations and Error Handling requires specific skills (SQL, ...)
- Microsoft Power BI
 - Errors are highlighted during import already
 - Data Transformations and Error Handling is quite easy

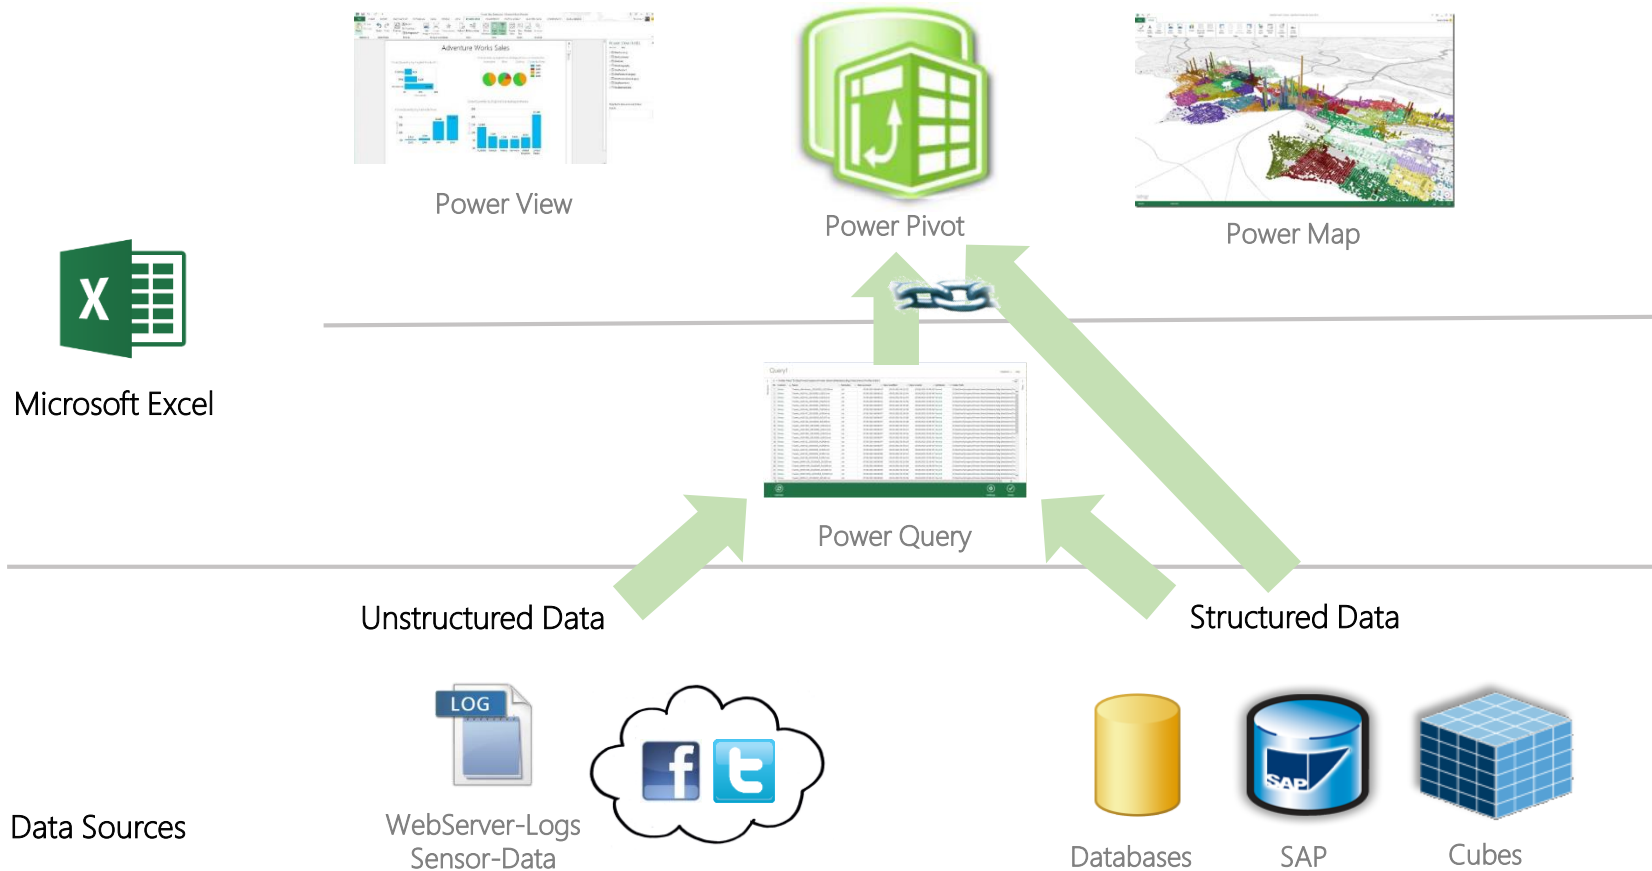

Fast Iterations

- SAP HANA
 - Reloading data is quite complex
 - Upload files one by one
 - Import files one by one
 - Manually trigger transformation steps
- Microsoft Power BI
 - Simple reload of data
 - Multiple files at once
 - One clean process

Complex Analysis & Visualization

- SAP HANA
 - (Native) integration of **R** in SAP HANA
 - Integrated visual analysis tool is quite basic
 - Use separate front end (SAP LUMIRA) for Visualization
 - Other user experience
- Microsoft Power BI
 - Medium complex analysis possible
 - Fully integrated into Microsoft Excel
 - Charts, Pivot Tables, conditional formatting, ...
 - integrate able with all other Excel Add-In
 - Power View & Power Map for interactive visual analysis

An efficient laboratory

The factory

Automated

Host it and run it

At Enterprise Scale

For Real-time Enterprise

Easy to consume

Integrated in the business process

Analyze on mass data

A possible Factory Architecture

Frontends
Ad-Hoc &
Standard reports

Prediction &
Data Science

Scalable & High-
Performance
Database

Unstructured Data

Data Sources

Structured Data

Conclusion

1. Identify field!
2. Identify goals!
3. Find solution!
4. Provision solution:
